Prepared by AKRF, Inc.

April 20, 2023

AMS Buchanan DRAFT Traffic Impact Study

A. INTRODUCTION

This Traffic Impact Study (TIS) provides the results of a detailed traffic analysis that was completed to assess the potential traffic and transportation impacts of the proposed residential development located at the southeast corner of the intersection of Craft Lane and Albany Post Road (the “Proposed Project”) in the Village of Buchanan, Westchester County, NY, also known as Section 43.16, Block 3, Lots 16 and 16A and Section 43.20, Block 2, Lot 2. Potential traffic impacts were analyzed at intersections proximate to the Project Site (the “Study Area”). The TIS also summarizes the existing pedestrian environment and identifies potential improvements for the Village to consider.

Potential impacts of the Proposed Project were analyzed using the *Highway Capacity Manual* (HCM) 6th Edition and Percentile Delay methodologies (Synchro 11 software) to calculate existing and future traffic operating conditions (Level of Service (“LOS”) and average delay) at each of the Study Area intersections.

The TIS describes traffic operations for existing conditions within the Study Area, for conditions in the future without the Proposed Project (the “No Build” analysis), and in the future with the Proposed Project (the “Build” analysis). As described below, the Proposed Project is not anticipated to have a significant adverse impact on any of the Study Area intersections.

B. EXISTING CONDITIONS

STUDY AREA AND DATA COLLECTION PROGRAM

To assess the traffic impacts associated with the Proposed Project, a Study Area was identified in consultation with the Village’s Traffic Engineering Consultant, considering key intersections that had the potential to be affected by project-generated trips. Three locations were identified for analysis (see **Figure 1**):

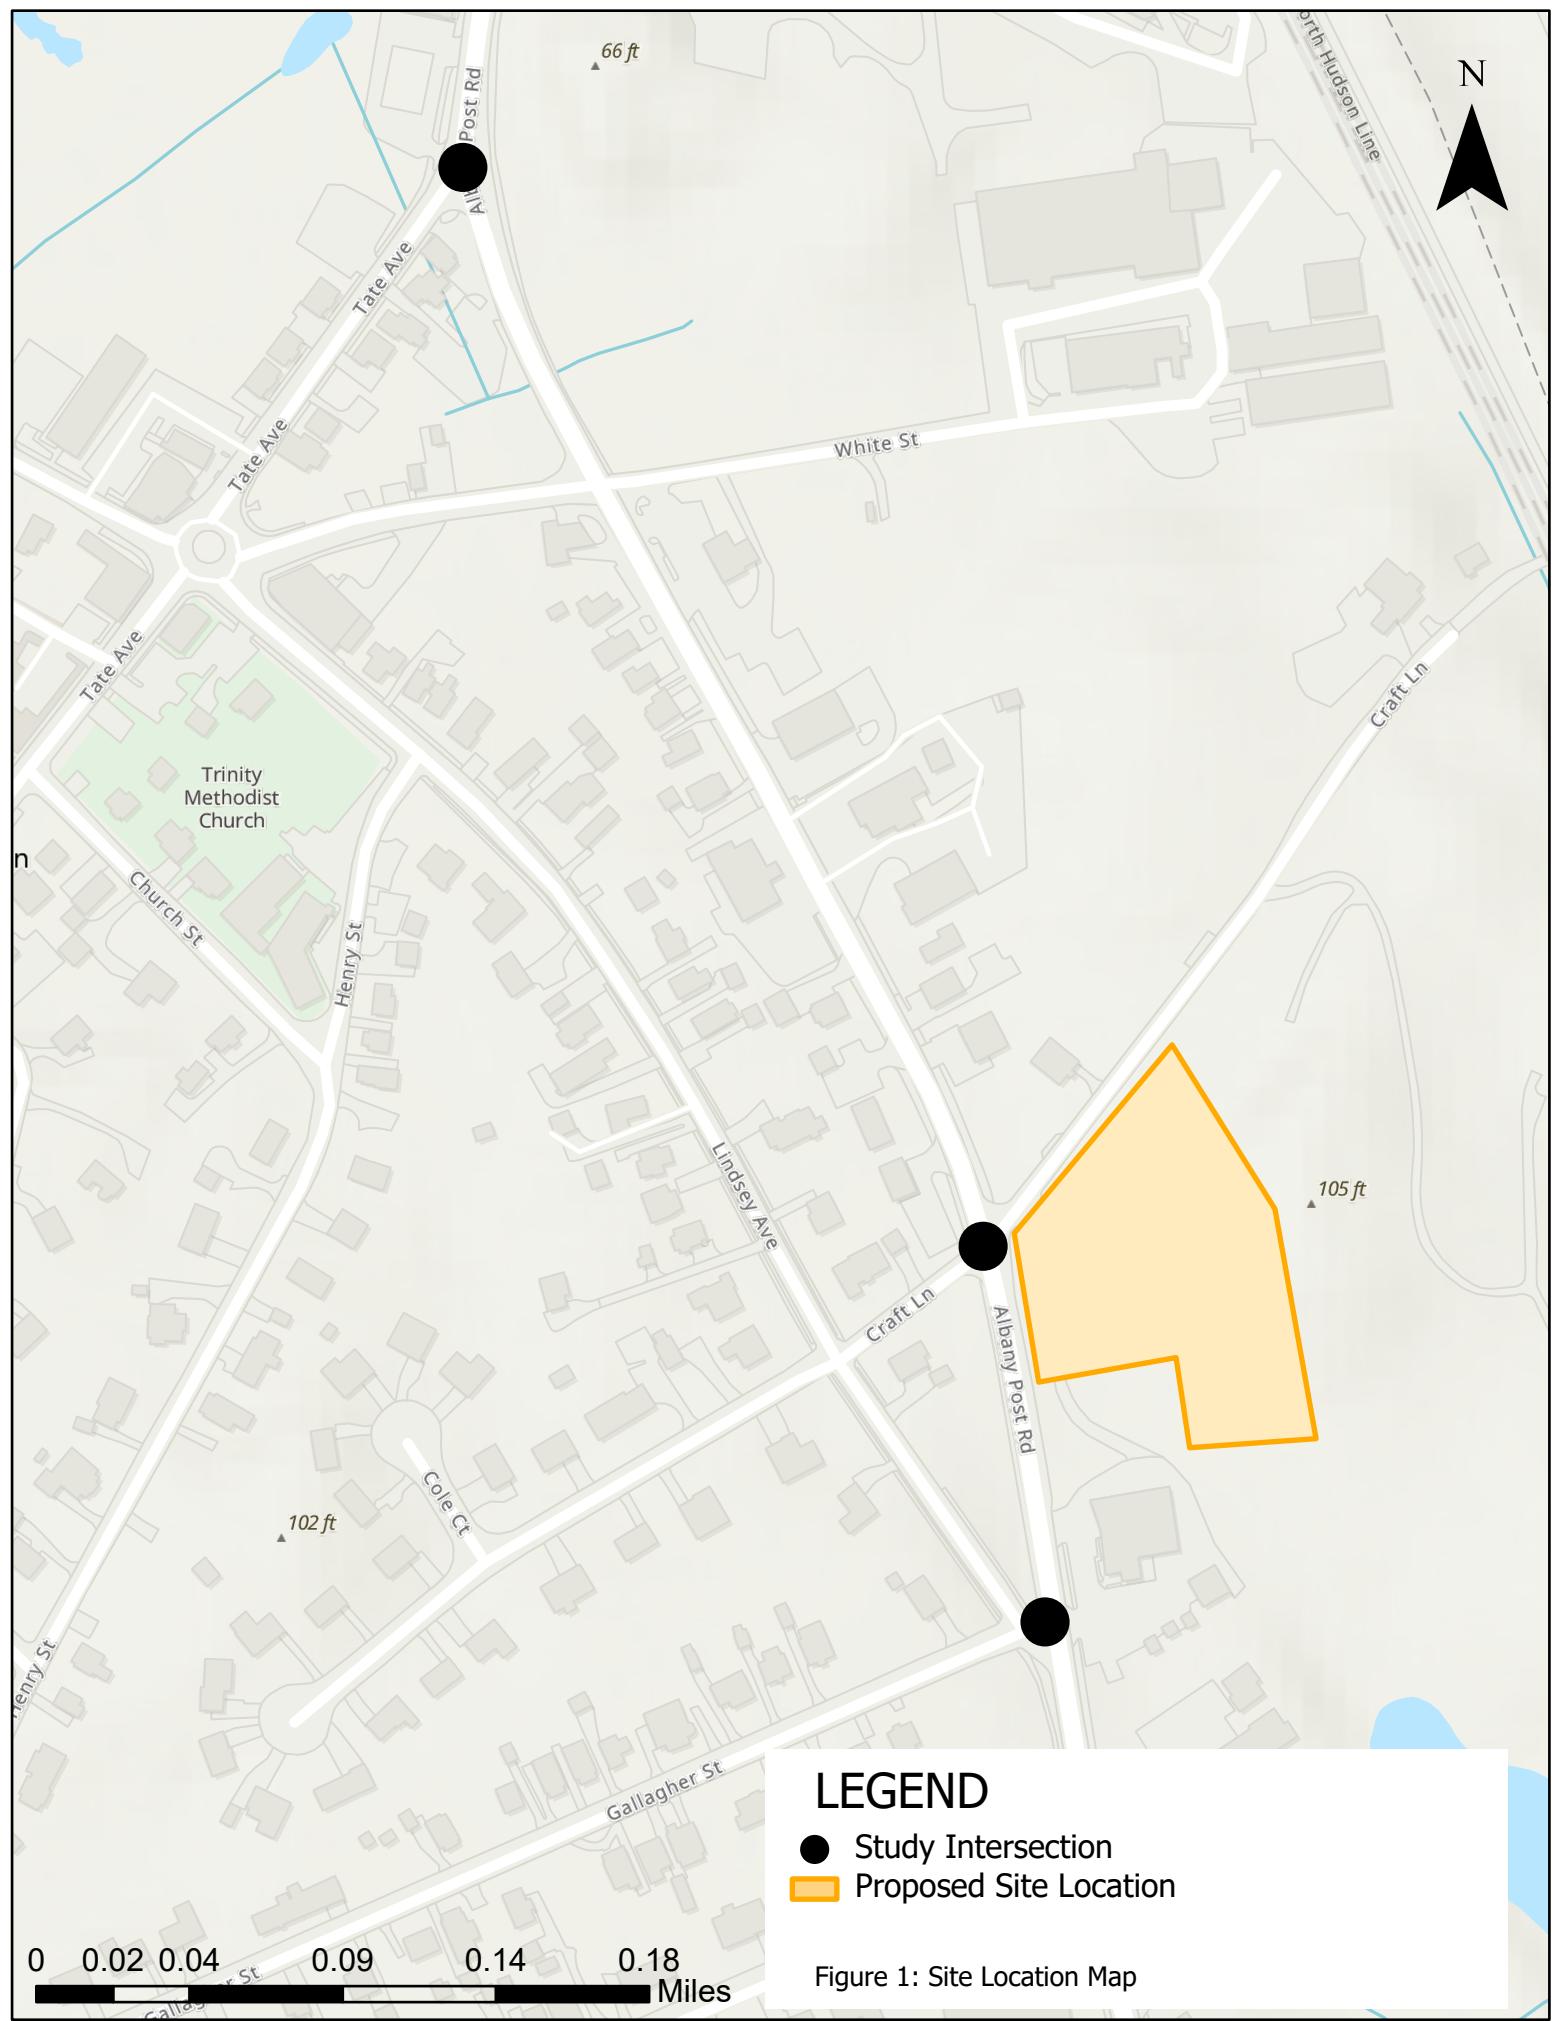

1. Albany Post Road & Tate Avenue
2. Albany Post Road & Craft Lane
3. Albany Post Road & Lindsey Avenue/Gallagher Street

To establish the baseline traffic conditions, traffic counts and observations were collected at the Study Area intersections. Automatic Traffic Recorder (ATR) counts were also collected for a nine-day period in February 2023. Turning Movement Counts (TMC), field observations, and pedestrian counts were collected during the weekday AM and PM peak periods concurrently with the ATR data collection on Tuesday, February 7, 2023 on a fair-weather day when school was in session. The traffic counts are provided in **Appendix A**.

Field inventories of roadway geometry were also conducted and signal timing plans were requested from New York State Department of Transportation (NYSDOT) to provide appropriate inputs to the operational analyses.

ROADWAY AND INTERSECTION CHARACTERISTICS

The following are brief descriptions of the major roadways and intersections within the Study Area.

ALBANY POST ROAD (NYS ROUTE 9A)

Albany Post Road, also known as NYS Route 9A, is an urban minor arterial and State highway under the jurisdiction of the New York State Department of Transportation (NYSDOT) that generally traverses in a north-south direction. Albany Post Road within the Study Area generally provides one moving lane in each direction, carries approximately 12,900 vehicles per day (NYSDOT 2019 AADT), and varies in width between approximately 36 and 24 feet. The shoulders along Albany Post Road in the Study Area are generally 10 feet wide or less in the southbound direction and 7 feet wide or less in the northbound direction. Albany Post Road has a speed limit of 30 miles per hour (mph) in the Study Area. There are sidewalks on the west side of Albany Post Road within the Study Area north of Tate Avenue. Within the Study Area, Albany Post Road does not have bicycle infrastructure. Pedestrians and bicycles may be accommodated along the Albany Post Road shoulders.

TATE AVENUE

Tate Avenue is a local roadway that generally traverses in a northeast-southwest direction and terminates at its intersection with Albany Post Road. Within the Study Area, Tate Avenue generally provides one moving lane in each direction and is approximately 30 feet wide. Tate Avenue has a speed limit of 30 mph in the Study Area. There are sidewalks on both sides of Tate Avenue within the Study Area. Within the Study Area, Tate Avenue does not have bicycle infrastructure. Pedestrians and bicycles may be accommodated along the sidewalks or roadway.

CRAFT LANE

Craft Lane is a local roadway that generally traverses in an east-west direction and terminates east of Albany Post Road (just past Metro-North tracks) and west of Lindsey Avenue. Within the Study Area, Craft Lane is generally two-way, provides one moving lanes in each direction, and varies in width between approximately 30 and 20 feet. Between Lindsey Avenue and Albany Post Road, Craft Lane is one-way westbound. Craft Lane has a speed limit of 30 mph. There are no sidewalks or bicycle infrastructure along Craft Lane within the Study Area. Pedestrians and bicycles may be accommodated along the leftmost side of the roadway.

LINDSEY AVENUE

Lindsey Avenue is an urban major collector roadway that generally traverses in a north-south direction and terminates at its intersection with Albany Post Road. Within the Study Area, Lindsey Avenue generally provides one moving lane in each direction and is approximately 37 feet wide. Lindsey Avenue has a speed limit of 30 mph in the Study Area. There are sidewalks on both sides of Lindsey Avenue within the Study Area. Within the Study Area, Lindsey Avenue does not have bicycle infrastructure. Pedestrians and bicycles may be accommodated along the sidewalks or roadway.

GALLAGHER STREET

Gallagher Street is a local roadway that generally traverses in an east-west direction and terminates at its intersection with Albany Post Road. Within the Study Area, Gallagher Street generally provides one moving lane in each direction and is approximately 32 feet wide. Gallagher Street has a speed limit of 30 mph in the Study Area. There are no sidewalks or bicycle infrastructure along Gallagher Street within the Study Area. Pedestrians and bicycles may be accommodated along the leftmost side of the roadway.

2023 EXISTING TRAFFIC CONDITIONS

PEAK HOURS AND TRAFFIC VOLUMES

Based on a review of the traffic count data, the peak hours for the Study Area were determined to be as follows:

- Weekday AM Peak Hour - 7:00 AM to 8:00 AM
- Weekday PM Peak Hour - 4:00 PM to 5:00 PM

Figure 2 shows the turning movement volumes at the Study Area intersections for existing conditions for the peak hours analyzed.

CAPACITY ANALYSIS METHODOLOGY

Signalized Intersections

The operation of signalized intersections in the Study Area was analyzed by applying the Percentile Delay Methodology included in the Synchro 11 traffic signal software. The Percentile Delay Methodology differs from the *Highway Capacity Manual (HCM)* Methodology as the former calculates vehicle delays for five different percentile scenarios (10th, 30th, 50th, 70th and 90th) and taking the volume weighted average of the scenarios, whereas the HCM methodology calculates delay for a single average scenario. In addition, the Percentile Delay Methodology includes an additional queue delay component to account for the effects of queues and blocking on short links and turning bays. The HCM methodology evaluates signalized intersections for average delay per vehicle and for Level of Service (LOS).

LOS can be characterized for the entire intersection, each intersection approach, and each lane group. Delay alone is used to characterize LOS for the entire intersection or an approach. Total delay and volume-to-capacity (v/c) ratio are used to characterize LOS for a lane group. The volume-to-capacity ratio quantifies the degree to which a phase's capacity is utilized by a lane group.

LOS A describes operation with a delay of 10 seconds per vehicle or less and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.

LOS B describes operation with delay between 10 and 20 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.

LOS C describes operation with delay between 20 and 35 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is favorable or the cycle length is moderate. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.

LOS D describes operation with delay between 35 and 55 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.

LOS E describes operation with delay between 55 and 80 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.

LOS F describes operation with delay exceeding 80 seconds per vehicle or a volume-to-capacity ratio greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

A lane group can incur a delay less than 80 seconds per vehicle when the volume-to-capacity ratio exceeds 1.0. This condition typically occurs when the cycle length is short, the signal progression is favorable, or both. As a result, both the delay and volume-to-capacity ratio are considered when lane group LOS is established. A ratio of 1.0 or more indicates that cycle capacity is fully utilized and represents failure from a capacity perspective (just as delay in excess of 80 seconds per vehicle represents failure from a delay perspective).

The delay criteria for the range of service levels for signalized intersections are shown in **Table 1**.

Table 1
LOS Criteria for Signalized Intersections

Total Delay Per Vehicle	Level-of-Service (LOS)⁽¹⁾	
	v/c ratio ≤ 1.0	v/c ratio > 1.0
≤ 10.0 seconds	A	F
>10.0 and ≤ 20.0 seconds	B	F
>20.0 and ≤ 35.0 seconds	C	F
>35.0 and ≤ 55.0 seconds	D	F
>55.0 and ≤ 80.0 seconds	E	F
>80.0 seconds	F	F

Note: (1) For approach-based and intersection-wide assessments, LOS is defined solely by delay.

Source: Transportation Research Board. *Highway Capacity Manual, 6th Edition*.

Unsignalized Intersections

LOS for two-way stop-controlled (TWSC) and all-way stop-controlled (AWSC) intersections is determined by the computed or measured control delay using HCM Methodology for each minor-street movement (or shared movement) as well as major-street left-turns at TWSC intersections and for all movements at AWSC intersections. LOS is not defined for the intersection as a whole for TWSC intersections.

The LOS criteria for both TWSC and AWSC unsignalized intersections are summarized in **Table 2**.

Note that the LOS criteria for unsignalized intersections are somewhat different from the criteria used in signalized intersections. At TWSC intersections, drivers on the stop-controlled approaches are required to select gaps in the major-street flow in order to execute crossing or turning maneuvers. In the presence of a queue, each driver on the controlled approach must also use some time to move into the front-of-queue position and prepare to evaluate gaps in the major-street flow. AWSC intersections require drivers on all approaches to stop before proceeding into the intersection.

Table 2
LOS Criteria for Unsignalized Intersections

Control Delay Per Vehicle	Level-of-Service (LOS)⁽¹⁾	
	v/c ratio ≤ 1.0	v/c ratio > 1.0
≤ 10.0 seconds	A	F
>10.0 and ≤ 15.0 seconds	B	F
>15.0 and ≤ 25.0 seconds	C	F
>25.0 and ≤ 35.0 seconds	D	F
>35.0 and ≤ 50.0 seconds	E	F
>50.0 seconds	F	F

Note: (1) For TWSC intersections, the LOS criteria apply to each lane on a given approach and to each approach on the minor street (for TWSC intersections). LOS is not calculated for major-street approaches or for the intersection as a whole.

Source: Transportation Research Board. *Highway Capacity Manual, 6th Edition*.

2023 EXISTING TRAFFIC CONDITIONS

During peak hours, LOS D operations are generally considered to be acceptable operating conditions for signalized and unsignalized intersections. As shown in **Table 3**, all lane groups operate at an overall LOS D or better under the No Build conditions during the weekday AM and PM peak hours (see **Appendix B** for Synchro 11 outputs for all study area intersections).

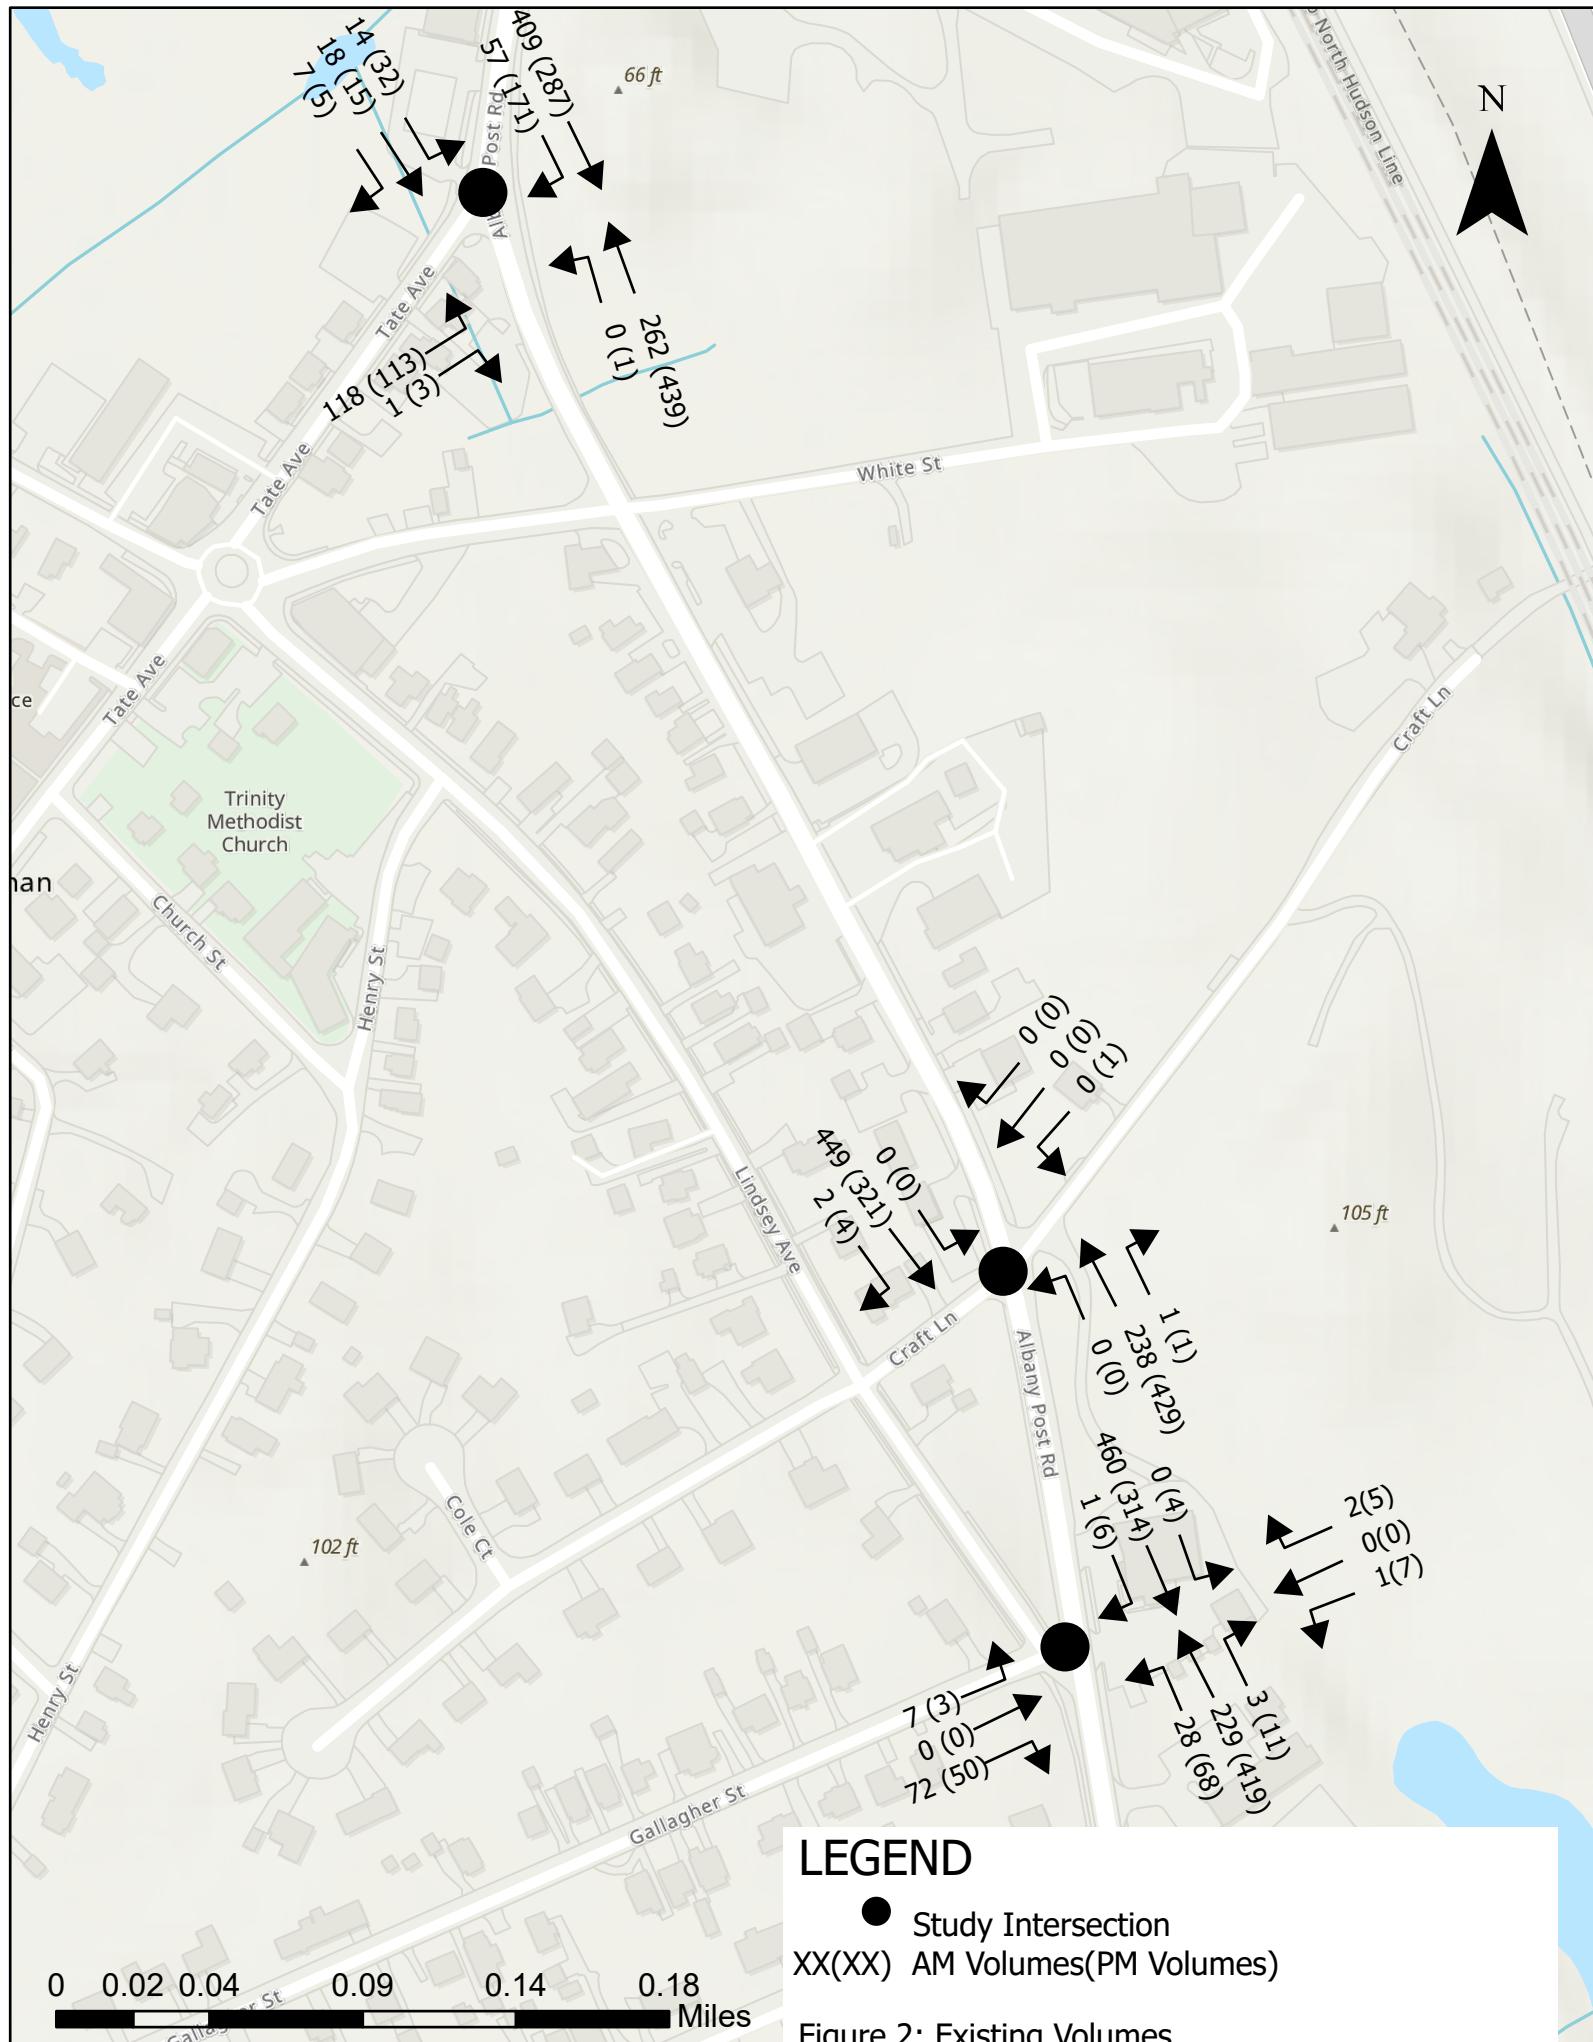

Table 3
2023 Existing Conditions Level of Service Analysis

Intersection	Lane Group	AM Peak Hour			PM Peak Hour

CRASH ASSESSMENT

Crash data for Study Area intersections were obtained from NYSDOT for the five-year period between August 1, 2017 and July 31, 2022. The data obtained quantify the total number of reportable crashes (involving fatality, injury, or more than \$1,000 in property damage), fatalities, and injuries during the study period, as well as a yearly breakdown of vehicular crashes with pedestrians and bicycles at each location. The raw crash data from NYSDOT is provided in **Appendix C**.

During the study period, a total of 17 reportable and non-reportable crashes, zero fatalities, one injury, and zero pedestrian/bicyclist-related crashes occurred at the Study Area intersections. There are no high crash locations in the Study Area, defined as an intersection with more than ten crashes per year. A majority of the crashes were related to driver error. Approximately 22 percent of crashes (five crashes) involved animals such as deer.

Table 4 summarizes the total crashes by intersection during the study period.

Table 4
Crash Summary

Intersection		Study Period						Total Fatalities	Total Injuries		
North-South Roadway	East-West Roadway	All Crashes by Year									
		2017*	2018	2019	2020	2021	2022*				
Albany Post Road	Tate Avenue	1	1	1	2	4	0	0	0		
Albany Post Road	Craft Lane	0	1	2	1	1	0	0	0		
Albany Post Road	Lindsey Avenue Gallagher Street	0	0	1	0	2	0	0	1		

Source: NYSDOT August 1, 2017 through July 31, 2022 crash data.
Notes: *Partial-year data

The intersection crash rates compared to the State-wide average crash rates are provided in **Table 5**. All study intersections experienced crash rates lower than the State-wide average for a comparable facility.

Table 5
Table Title

Intersection	Crash Rate	NYSDOT Crash Rate	Difference
Albany Post Road & Tate Avenue	0.33	0.53	-38%
Albany Post Road & Craft Lane	0.26	0.28	-8%
Albany Post Road & Lindsey Avenue/Gallagher Street	0.13	0.28	-53%

C. FUTURE WITHOUT THE PROPOSED PROJECT

2026 NO BUILD TRAFFIC CONDITIONS

The Future without the Proposed Project, or “No Build Condition,” is an interim scenario that establishes a future baseline condition that is likely to occur without the Proposed Project. The No Build year is the same year as the Build year of the Proposed Project (2026). No Build traffic conditions were developed based on the following procedure:

- Increase the 2023 Existing Conditions traffic volumes by 1.0 percent per year from 2023 (Existing year) to 2026 (Build year) for background growth, which was agreed upon by the Village’s consulting traffic engineer.
- Manually add trips from pending and approved developments (“No Build projects”) located in the vicinity of the study area. This included a mixed commercial and residential development proposed at 3095 Albany Post Road. According to the Village of Buchanan, the 3095 development is proposed to comprise 51 residential units and 2,275 SF of commercial land use. Total trips generated by the proposed development, estimated in accordance with the *ITE Trip Generation Manual 11th Edition*, were added along Albany Post Road based on the existing traffic patterns.

Traffic volumes for the 2026 No Build Condition for the peak hours analyzed are shown in **Figure 3**.

As shown in **Table 6**, all lane groups continue to operate at an overall LOS D or better under the No Build conditions during the weekday AM and PM peak hours. Synchro reports are provided in **Appendix D**.

Table 6
2026 No Build Conditions Level of Service Analysis

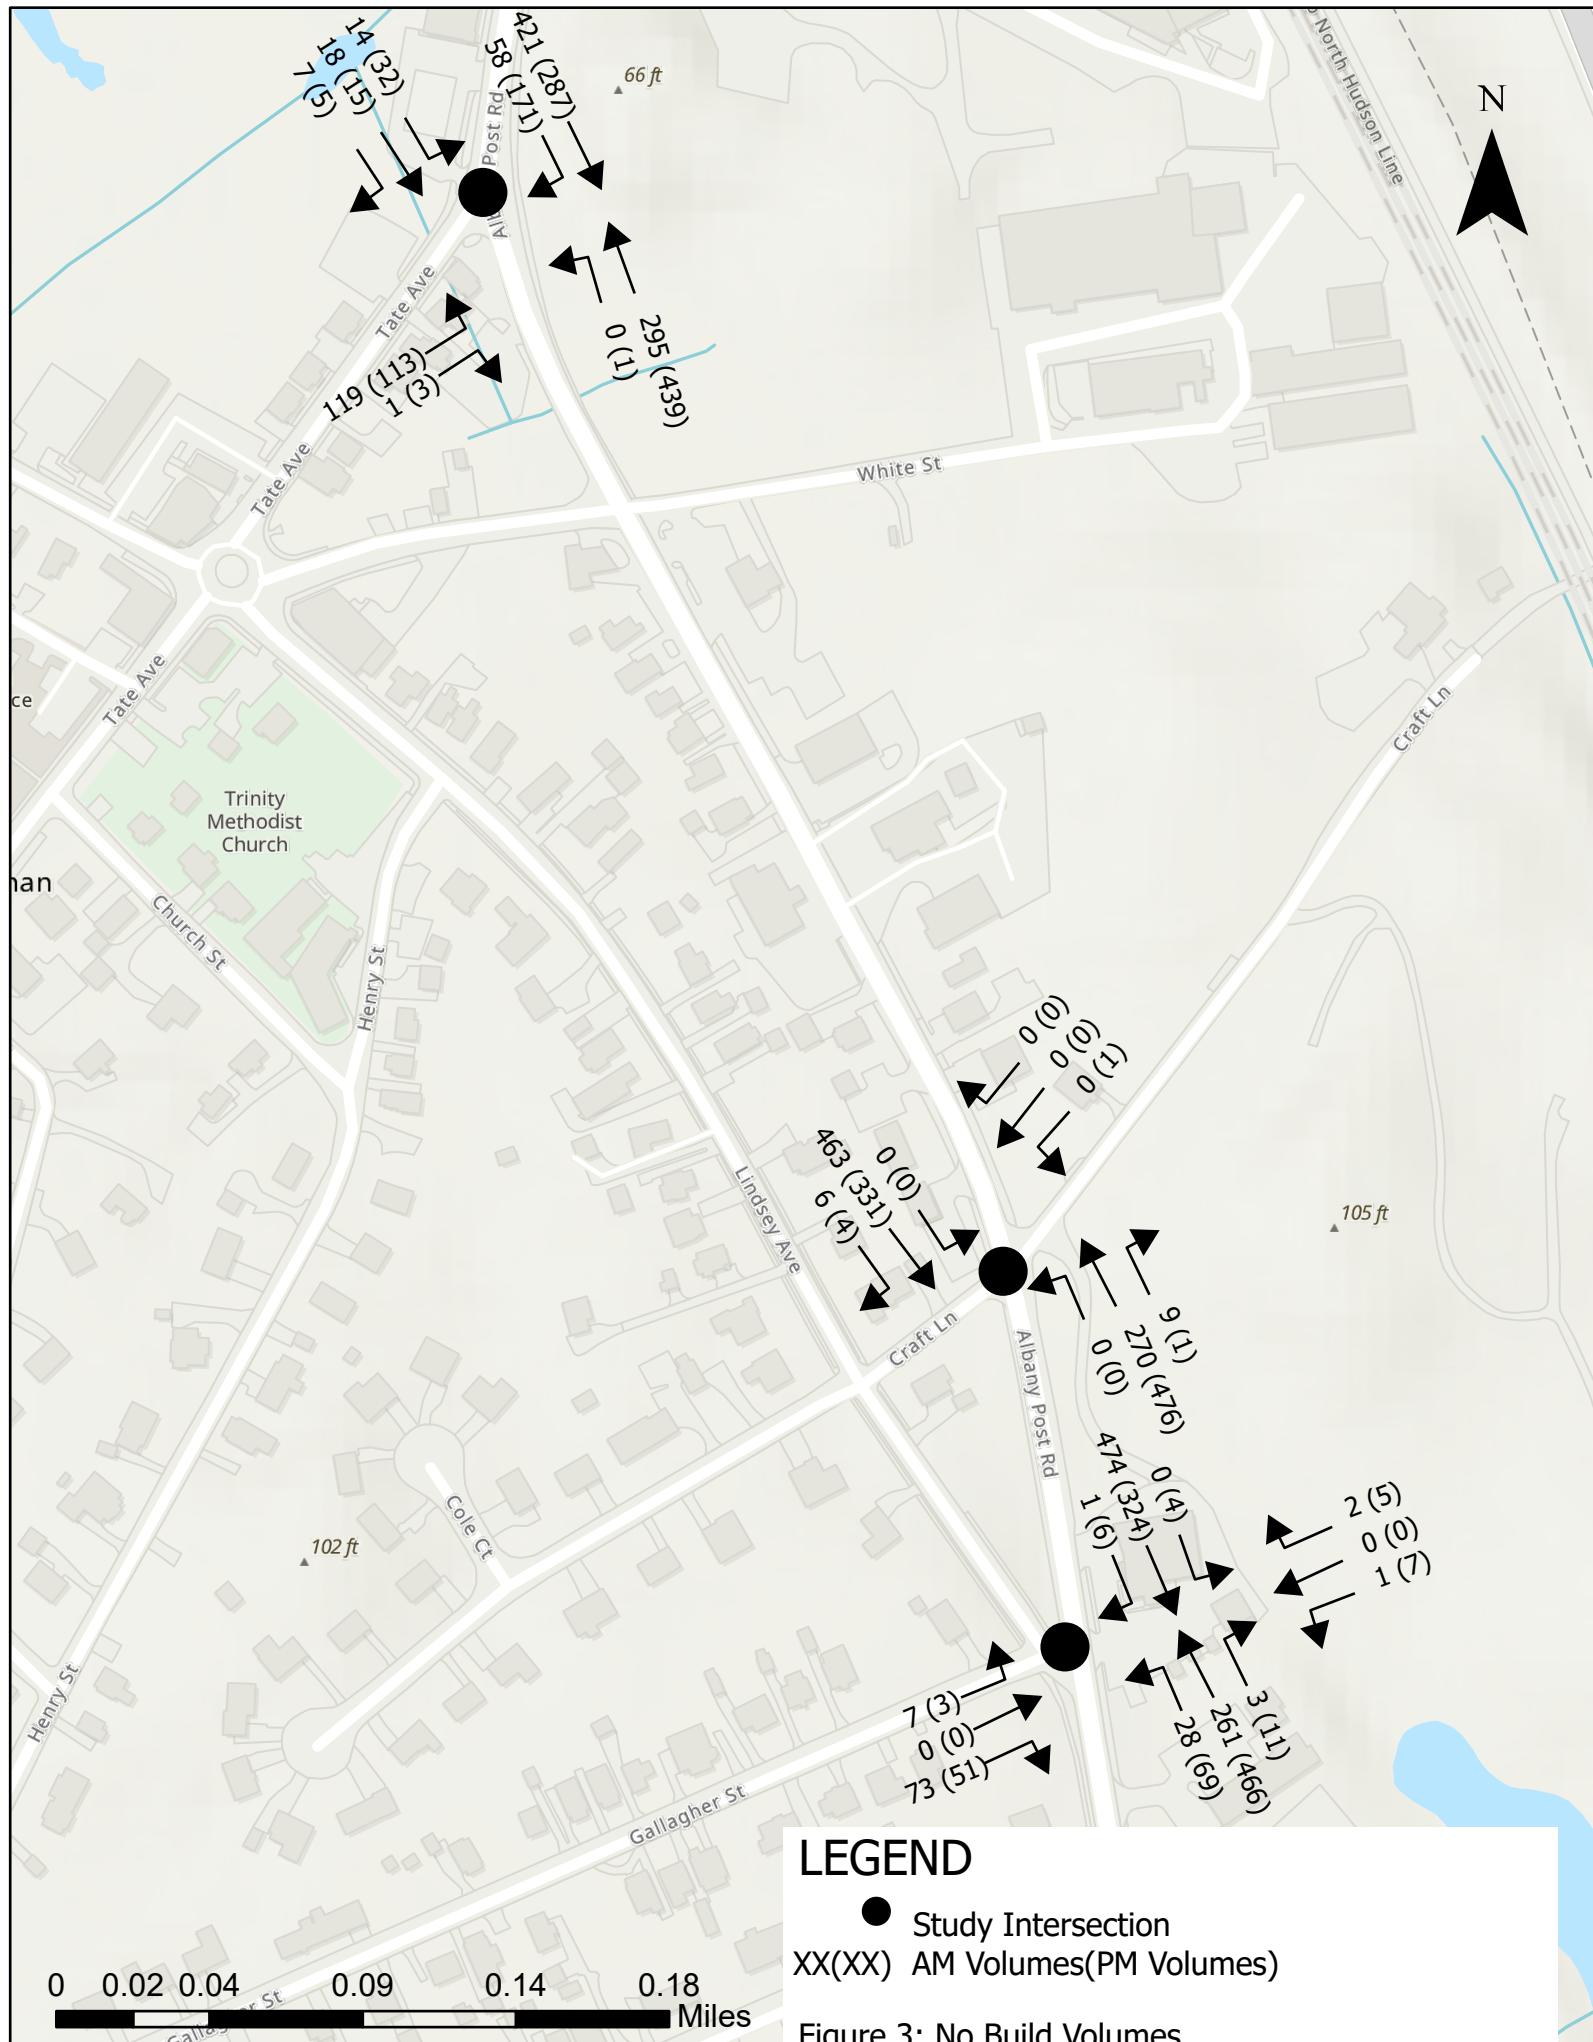

Figure 3: No Build Volumes

D. POTENTIAL IMPACTS OF THE PROPOSED PROJECT

PROJECT DESCRIPTION

The Proposed Project is a five-story 148-unit multifamily residential development with 227 parking spaces and one stop-controlled driveway on Craft Lane. The Proposed Project would be built on a currently vacant parcel and is anticipated to be completed in 2026.

TRIP GENERATION

The estimated number of trips generated by the Proposed Project were developed using the *ITE Trip Generation Manual 11th Edition*. As shown in **Table 7**, the Proposed Project is estimated to generate 53 vehicle trips during the weekday AM peak hour (14 in and 39 out) and 63 vehicle trips during the weekday PM peak hour (38 in and 25 out).

Table 7
Trip Generation Summary

Building Component	Size	Peak Hour	Trips		
			In	Out	Total
Multifamily Housing (Mid-Rise)	148 units	AM	14	39	53
		PM	38	25	63

Note: ITE Land Use Code 221 – Multifamily Housing (Mid-Rise)
AM peak hour of generator equation: $T = 0.32(X) + 5.84$, 26% entering, 74% exiting
PM peak hour of generator equation: $T = 0.32(X) + 15.57$, 60% entering, 40% exiting

2026 BUILD TRAFFIC CONDITIONS

The Project-generated vehicle trips were assigned to the Study Area intersections, as shown in **Figure 4**, and added to the No Build traffic volumes in order to estimate the Build traffic volumes. Traffic volumes for the 2026 Build Condition are shown in **Figure 5**.

For this analysis, and pursuant to standard industry practice, significant adverse traffic impacts are defined as: (1) a change in LOS D or better to LOS E or F; (2) a change from LOS E to LOS F; or (3) an increase of 10 percent or more in traffic volumes for LOS F. The impact criteria are applied to the approach/lane group LOS for signalized intersections and approach/movement group LOS for unsignalized intersections.

Table 8 and **Table 9** present a comparison of the 2026 No Build and 2026 Build Conditions for the Study Area intersections for the AM and PM peak hours respectively. As shown therein, the addition of Project-generated traffic would not result in any significant adverse traffic impact to LOS at the Study Area intersections. Accordingly, no traffic mitigation is required. Synchro reports are provided in **Appendix E**. It should be noted that the Albany Post Road and Craft Lane intersection, with the Project-generated vehicle trips, does not meet traffic signal warrant criteria as shown in **Appendix F**.

LEFT TURN LANE WARRANT ANALYSIS

In addition to the standard LOS analyses, the following intersections were evaluated to determine the need for a left turn lane using the criteria set forth in Table 9-24 of the American Association of State Highway and Transportation Official's ("AASHTO") *A Policy on Geometric Design of Highways and Streets 7th Edition* (i.e., the "Green Book"):

- Albany Post Road at Craft Lane
- Albany Post Road at Lindsey Avenue

As shown in **Table 10**, the following movements meet the minimum warrant volume required to consider implementation of a left turn lane in the 2026 Build Condition (i.e., with the Proposed Project):

- Albany Post Road & Craft Lane – Westbound left (i.e., from Craft Lane onto Albany Post Road)
- Albany Post Road & Craft Lane – Southbound left (i.e., from Albany Post Road to Craft Lane)
- Albany Post Road & Lindsey Avenue – Eastbound left
- Albany Post Road & Lindsey Avenue – Westbound left
- Albany Post Road & Lindsey Avenue – Northbound left

Despite meeting the minimum volumes necessary, left turn lanes are not recommended at these locations because these intersections operate at an acceptable LOS C or better, which indicates acceptable delays of fewer than 20 seconds per vehicle according to HCM. The left turn lane warrant analysis information is provided in **Appendix F**.

Table 10
Left Turn Warrant Volume Summary

Intersection	Movement	AM Peak Hour		PM Peak Hour	
		Left Turn Volume	Major Road Volume (per lane)	Left Turn Volume	Major Road Volume (per lane)
Albany Post Road & Craft Lane	Westbound Left	16	367	11	404
	Northbound Left	0	367	0	404
	Southbound Left	8	367	23	404
Albany Post Road & Lindsey Avenue	Eastbound Left	7	379	3	408
	Westbound Left	1	379	7	408
	Northbound Left	28	379	69	408
	Southbound Left	0	379	4	408

SITE ACCESS AND CIRCULATION

The Proposed Project would have a single driveway at Craft Lane, which would be approximately 26 feet wide at its approach. Given the residential nature of the Proposed Project, the width of the driveway is appropriate for passenger cars and moving trucks, providing sufficient space for vehicles to turn into and out of the Site. In addition, an emergency vehicle access way will be provided to the Project Site along Albany Post Road.

PARKING

The Proposed Project includes 227 parking spaces, including 65 surface parking spaces and 162 garage parking spaces, to support the 148 residential units, equating to approximately 1.53 spaces per unit. The Village of Buchanan Zoning Code currently requires 2 parking spaces per dwelling unit within the C-2 Overlay District, which would require the Proposed Project to provide 296 parking spaces. The Applicant has petitioned the Village for amendments to the Zoning Code, including reducing the required minimum parking required for multifamily buildings on sites greater than 5 acres in the Overlay District to 1.5 spaces per dwelling unit. Based on the *ITE Parking Generation Manual 5th Edition*, the parking demand of the Proposed Project is 1.47 parking spaces per dwelling unit, or approximately 218 parking spaces. Therefore, both the proposed minimum parking ratio (1.5 per unit) and the actual number of spaces proposed for the Project (227 spaces, 1.53 per unit), exceeds the parking demand of the Proposed Project pursuant to the *ITE* standards.

PEDESTRIAN ENVIRONMENT ASSESSMENT

Figure 6 presents the existing pedestrian facilities in the vicinity of the Proposed Project, in addition to the Site location, the proposed sidewalk at the Site and Hardware Store frontage, and proposed Albany Post Road crosswalk. The Albany Post Road and Craft Lane intersection does not currently provide any pedestrian amenities nor any pedestrian crossings. Lindsey Avenue does provide pedestrian sidewalks/walkways between Craft Lane and Tate Avenue. At the Lindsey Avenue and Tate Avenue intersection, pedestrian crosswalks are provided at each approach to the intersection, with painted splitter island/refuge areas on Lindsey Avenue, Westchester Avenue, Tate Avenue, and White Street.

The Proposed Project would begin to address the lack of pedestrian facilities along Albany Post Road by providing a sidewalk along the Site frontage, and the frontage of the Hardware Store, on the east side of Albany Post Road and a crosswalk across Albany Post Road at Lindsey Avenue. Additional improvements the Village and NYSDOT could undertake to continue to improve the pedestrian environment includes:

- Continue to work with NYSDOT to identify opportunities to construct sidewalks along Albany Post Road
- Continue to require that future developments along Albany Post Road include sidewalks along their frontage
- Identify locations to facilitate pedestrian crossing across Albany Post Road
- Add sidewalks to Craft Lane between Albany Post Road and Lindsey Avenue
- Improve sidewalk conditions along Lindsey Avenue in areas that have deteriorated
- Convert the striped splitter islands at the Tate Avenue/Lindsey Avenue intersection into hardscape to improve the pedestrian refuge areas.
- Install crosswalk, curb ramps, and pedestrian signal heads at the Albany Post Road and Tate Avenue intersection across Tate Avenue

Figure 6: Existing and Proposed Pedestrian Infrastructure

TRANSIT RIDERSHIP

The area is serviced by the Metro-North Railroad Hudson Line at the Cortlandt station, approximately 1.5 miles south of the Site, which provides service between Poughkeepsie and New York City. The Westchester Bee-Line Bus Route 14 has a stop at the Tate Avenue and Westchester Avenue intersection, approximately one-quarter mile north of the Site, connecting Buchanan with Mohegan Lake, Peekskill, Ossining, and White Plains.

Based on data from the U.S. Census' 2021 American Community Survey Means of Transportation to Work, workers living in the Village of Buchanan primarily drive to work. Approximately one percent of workers commute to work by bus and eight percent commute to work by commuter rail.

MTA Metro-North estimates 1.25 workers per residential unit in a multifamily building. Therefore, the Proposed Project is anticipated to generate 185 commuters with 370 work commute trips per day (two one-way trips per commuter). Using the percentages above, the Proposed Project would generate approximately four bus trips and 30 commuter rail trips per day. Whereas bus commuters could walk to the Route 14 bus stop, train commuters would primarily drive to the Cortlandt station. Credit for transit trips was not taken for the trip generation of the Proposed Project.

E. CONCLUSIONS

Based on the results of the traffic analysis and crash assessment, the Proposed Project is not expected to result in significant adverse impacts to traffic on the adjacent roadway network. Based on the projected parking demand of the Proposed Project, per the *ITE Parking Generation Manual*, the 227 parking spaces proposed is sufficient to meet the anticipated demand.

Therefore, the Proposed Project is not expected to adversely impact traffic operations on the adjacent roadway network and no modifications to the roadway network are proposed. In addition, the Proposed Project will contribute to improving the pedestrian environment by providing sidewalks along the Site and Hardware Store frontage and adding a crosswalk across Albany Post Road.

Longitude/Easting:													
Accident Description/Officer's Notes Driver 1 reported that he was travelling north on Albany Post Road and was waiting to turn west into the Shell gas station. Driver 1 stated that the southbound traffic was stopped for the traffic light, and one of the vehicles waved him through the line of traffic. Driver 1 failed to observe that there was a turning lane for the southbound traffic. Driver 1 failed to see vehicle 2 traveling in the turning lane, subsequently causing a collision with vehicle 2. Damage on vehicle 1 was on the passenger side front door & front quarter panel. Vehicle 2 had damage to the front bumper. Both vehicles were able to be driven from the scene. No injuries reported on scene.

Accident Description/Officer's Notes

Upon investigation it was found that Driver 1 was traveling northbound on Albany Post Road when he attempted to turn left (west) into the Shell parking lot. Driver 1 failed to see that only one southbound traffic lane had a red light, and that the turning lane for Tate Avenue had a green arrow. Driver 1 pulled through the stopped traffic lane and then struck Vehicle 2 that was traveling southbound toward Tate Avenue. No injuries reported at the scene.

Appendix F

AMS Buchanan Traffic Impact Study

Warrant Analysis

TRAFFIC SIGNAL WARRANTS

WARRANT 3 - PEAK HOUR VEHICULAR VOLUME

Applicable: Yes No

Satisfied: Yes No

This signal warrant shall be applied only in unusual cases, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time period.

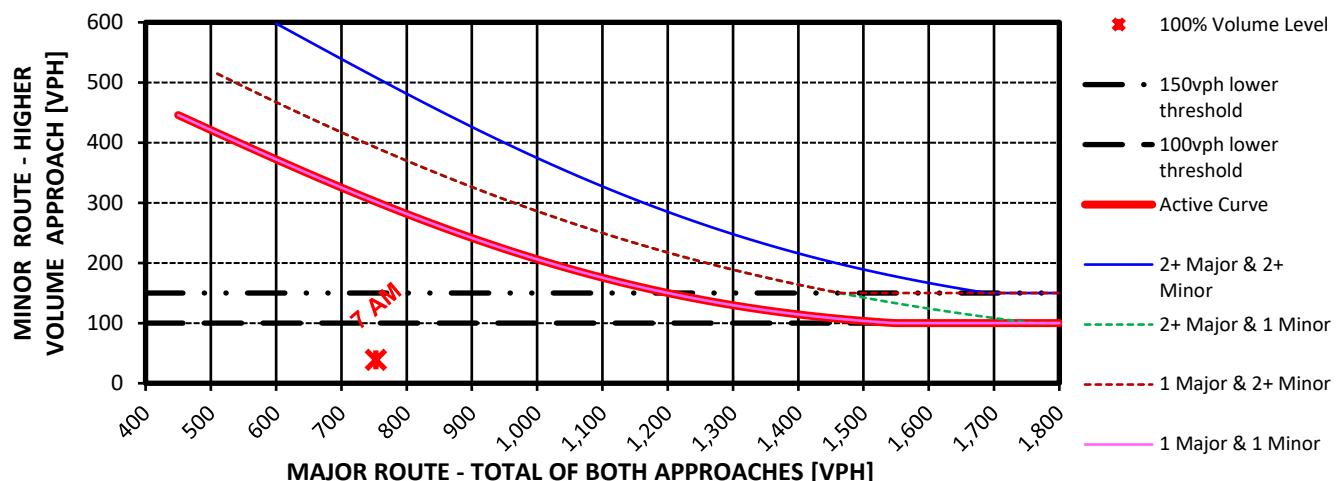

Signalization shall be considered if a point lies above the appropriate line or the Delay criteria is met.

Unusual case(s) justifying this Warrant:

Signal Warrant Test

Peak Hour Data		
Peak Hour	Major Route	Minor Route
7 AM	753	39

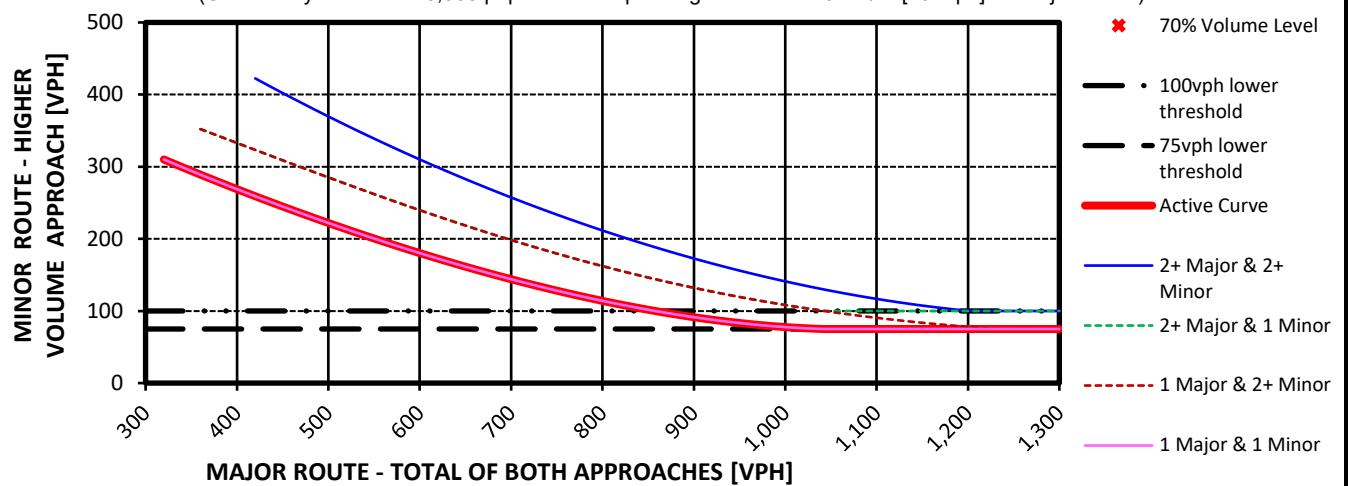

FIGURE W-3: Criteria for "100%" Volume Level

* Note: 150 vph applies as the lower threshold volume for a minor route approach with two or more lanes and 100 vph applies as the lower threshold volume threshold for a minor route approach with one lane.

FIGURE W-3: Criteria for "70%" Volume Level

(Community less-than 10,000 population or speeds greater-than 70 km/hr [40 mph] on Major Street)

* Note: 100 vph applies as the lower threshold volume for a minor route approach with two or more lanes and 75 vph applies as the lower threshold volume threshold for a minor route approach with one lane.

DELAY CRITERIA	1. Delay on Minor Approach (vehicle-hours)		2. Volume on Minor Approach (veh/hr)		3. Total Entering Volume (veh/hr)	
	Approaches Lanes:		1	2	Number of Approaches	
	Approaches Lanes:	1	2		<input checked="" type="checkbox"/> 3	<input type="checkbox"/> 4 or more
	Delay Criteria:	4.0	5.0		No. of Approaches	3
	Delay:	1.4		Volume Criteria	100	150
	Fullfilled?	<input type="checkbox"/> Yes	<input checked="" type="checkbox"/> NO	Volume :	39	
				Fullfilled?	<input checked="" type="checkbox"/> Yes	<input type="checkbox"/> NO
				Volume :	792	

Table 9-24. Suggested Left-Turn Lane Guidelines Based on Results from Benefit–Cost Evaluations for Unsignalized Intersections on Arterials in Urban Areas (16)

Left-Turn Lane Peak-Hour Volume (veh/h)	Three-Leg Intersection, Major-Road Volume (veh/h/in) that Warrants a Left-Turn Lane	Four-Leg Intersection, Major-Road Volume (veh/h/in) that Warrants a Left-Turn Lane
5	450	50
10	300	50
15	250	50
20	200	50
25	200	50
30	150	50
35	150	50
40	150	50
45	150	< 50
50 or More	100	< 50

Note: These guidelines apply where the major road is uncontrolled and the minor-road approaches are stop- or yield-controlled. Both the left-turn peak-hour volume and the major-road volume warrants should be met as shown in Figure 9-35.
